The revitalization cocktail injected into the scalp in MesoHair leads to stimulation and regeneration of the hair roots. See Chapter 9.2.

www.abadisteb.pub

Mesolift is most frequently used on the face, neck and cleavage/neckline area.

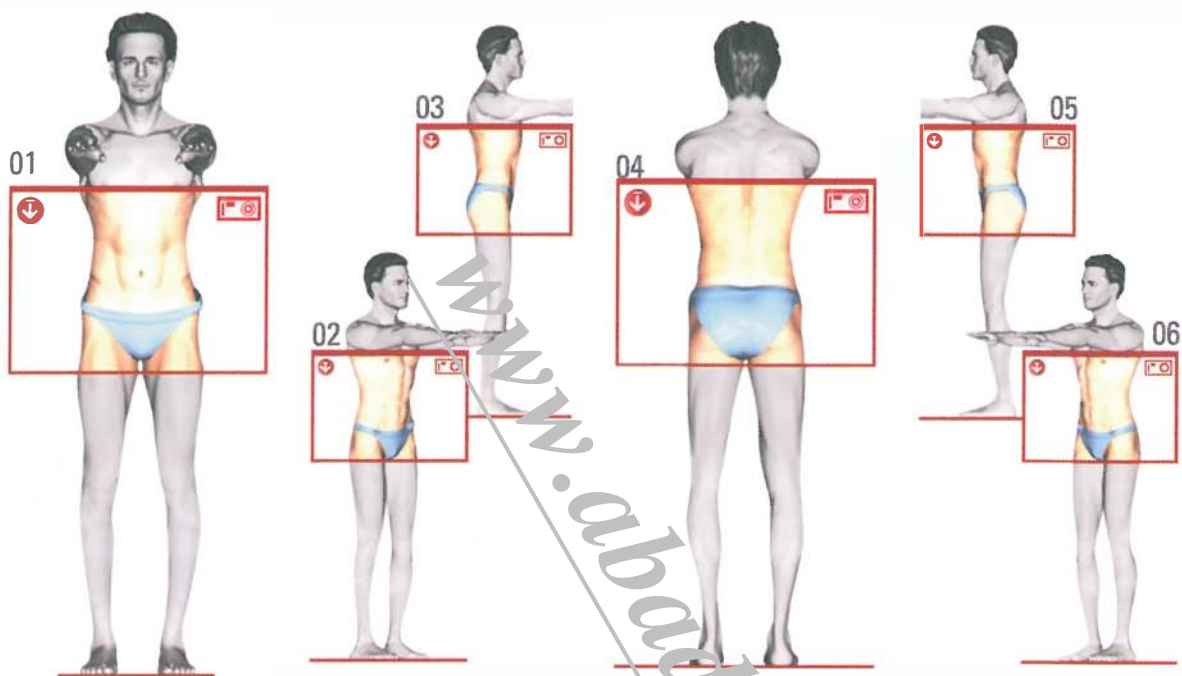

Once the individual components of the treatment have been selected, they are mixed in the correct way immediately before use on the patient.

Bauch und Flanken

3

The positioning templates – in this case “abdomen and hips” – supplied with FotoFinder® Guided Photography show the right image sections for each type of treatment, along with the corresponding pose and the correct angle.

5

Manual epidermal technique: the needle is stroked across the skin with very little downward pressure. An even pressure on the plunger applies the liquid uniformly, drop by drop.

The welt represents a superficial skin depot. Active substance transport away from the welt takes place slowly by diffusion.

Good lighting is needed when marking and treating the skin.

Test the patency of the needle and ensure that the viscosity of the liquid is correct before the treatment. A single drop should be ejected per trigger actuation in nappage mode.
